LISTING OF CLAIMS

A copy of all pending claims and a status of the claims is provided below.

1. (Previously Presented) A method for fabricating a field emission display, comprising:

forming a cathode electrode on a substrate;

forming an emitter having a carbon-based material on the cathode electrode;

depositing an emitter surface treatment agent on the substrate to cover the

emitter;

hardening the emitter surface treatment agent; and

removing the hardened emitter surface treatment agent from the substrate such that the

carbon-based material contained in the emitter can be exposed.

2. (Previously Presented) The method of claim 1, wherein the step of forming the emitter further

comprises:

printing a paste having the carbon-based material on the cathode electrode; and

heat-treating the printed paste at a temperate lower than a complete-baking temperature

for the paste.

3. (Original) The method of claim 2, wherein the paste is printed through a screen-printing

process using a metal mesh screen.

4. (Original) The method of claim 1, wherein the carbon-based material is selected from the

group consisting of a carbon nanotube, graphite, and diamond.

Samg-Hyuck AHN

Application Serial No.: 10/087,741

Art Unit: 2879

Reply to Non-Final Office Action Dated: July 18, 2005

5. (Original) The method of claim 1, wherein the emitter surface treatment agent is deposited

through a spin-coating process.

6. (Original) The method of claim 1, wherein the emitter surface treatment agent is hardened by

a heat-treatment process.

7. (Original) The method of claim 1, wherein the emitter surface treatment agent is a polyimide

solution.

8. (Original) The method of claim 2, wherein the printed paste is heat-treated at the

temperature of about 350-430°C for about 2 minutes.

9. (Original) The method of claim 6, wherein the heat-treatment process is performed in a state

where the substrate deposited with the surface treatment agent is located on a hot plate

maintaining a temperature of about 90°C for about 20 minutes.

10. (Previously Presented) A method for forming a carbon-based emitter, comprising:

forming an emitter including a carbon-based material;

forming a surface treatment agent over the emitter;

heating the surface treatment agent for forming a treatment film; and

removing at least a portion of the treatment film.

11. (Previously Presented) The method of forming a carbon-based emitter of claim 10, wherein

the carbon-based emitter is used in a field emission display.

12. (Previously Presented) The method of forming a carbon-based emitter of claim 10, wherein

the surface treatment agent is a polymide solution.

13. (Previously Presented) The method of forming a carbon-based emitter of claim 10, wherein

the heating the surface treatment agent is to a temperature of about 90°C.

14. (Previously Presented) The method of forming a carbon-based emitter of claim 13, wherein

the heating the surface treatment agent is conducted for about 20 minutes.

15. (Previously Presented) The method of forming a carbon-based emitter of claim 10, wherein

the carbon-based material includes at least one of carbon-nanotube, graphite, and diamond.
